

Risk of drowning !

Powerplant informs.

The power station's two extension hatches are operated automatically and opened without warning. The hatches move quickly and large amounts of water are released for a short time. The water level can be raised by several meters within seconds.

Avoid staying on the rocks in the stream as there is a risk of being trapped and flushed away is extremely large.

If the hatches is opened, you are asked to leave the area immediately and wait until the water surface has stabilized.

Falling into this turbulent water most likely means drowning.
